PHARMACY ERROR TRACKER
BETA TESTING SIGN OFF

Issues discovered from the first round of Beta Testing:

- Adding items using Manage Medication Types, Manage Patient Types, and Manage Workers
- Physician fields on the Log Error form requiring data even though "No" selected for the question *Was the physician notified.*
- IIMS Completed, Worker Notified and Physician Notified not showing when an Error has been loaded through the Search Error function. The fields have not been hidden using the Edit Error Form function.
- The Clear button on the Error Form could be pressed unintentionally, erasing forms-in-progress.

These issues have now been addressed. Please test these functions and advice the following by deleting the appropriate bold word/s in each of these statements:

- A medication type **can** / **cannot** be added using Manage Medication Types.
- A patient type **can** / **cannot** be added using Manage Patient Types.
- A worker **can** / **cannot** be added using Manage Workers.
- An error **can** / **cannot** be added using Log Error and selecting <u>No</u> to *Was the physician notified?* question.
- IIMS Completed, Worker Notified, and Was the physician notified sections of the Log Error form **are** / **are not** showing when an error has been selected from Search Error.
- When *Was the physician notified?* question is <u>No</u>, the Physician fields **are not** / **are** showing when an error has been selected from Search Error.
- When the Clear button in the Error form is pressed, a confirmation dialog **does** / **does not** appear, and the "Clear Form" button in that dialog prompt **does** / **does not** clear the form.

Any additional comments:

Perhaps you could consider instead of 'Patient type', You could use 'Patient Status'. Patient type could be misinterpreted by some health professionals

I have tested each of these functions and I am **happy** / **not happy** that issues have been rectified.
